

Salavat Galimov

Raleigh, NC | (910) 939-0267 | salgalia@proton.me | [trade42.github.io](https://github.com/trade42) | US citizen

Available: full-time from December 2026 through Summer 2027 (on leave for spring 2027); open to relocating to San Francisco

Flight videos and brace CAD: <https://drive.google.com/drive/folders/158aF8HUKg1S8hqNXXOVQKNSS-r63nkcE>

EE student who builds electromechanical systems end to end: CAD, fabrication, wiring, firmware, bring-up, and field testing.

EDUCATION

NC State University, Raleigh, NC | BS Electrical Engineering, second-year (junior standing by credit hours) **Expected May 2029**

Coursework: mechanics; electricity and magnetism; signals, circuits and systems; computer systems; multivariable calculus.

MECHATRONICS & HARDWARE EXPERIENCE

Drop Foot Active Brace | Wearable Robotic Assistive Device (solo design, build, and bring-up) **2026 – Present**

- Delivered reliable active foot lift for an adult client with drop foot by building a custom robotic brace: 3 iterations from concept to on-body testing in under 30 days.
- Engineered the paracord cable drive that turns servo rotation into foot lift, plus the 3D-printed ankle saddle and motor mounts (full CAD assembly); fabricated, assembled, and wired each prototype.
- Integrated dual 40 kg-cm servos, a thigh-mounted FSR gait sensor, and 3S Li-ion power on an Arduino Nano; wrote closed-loop C/C++ firmware that calibrates the FSR input and commands the servos.
- Ran 6+ debug iterations across power, sensor, and actuator subsystems, including a 5 V rail brownout fix; tested a 12 V DC motor + L298N H-bridge as an alternative actuator.

Robotics Design Challenge: Lab Automation Cell | Anthrogen (YC S24), Final Interview Round **2026**

- Designed a full lab automation cell in Fusion 360, evolved from an earlier X-rail pipetting gantry: instrument stations, per-station robotic handling, and automated sample transport between stations.

Aerobatic RC Plane | From-Scratch Design, Build, and Flight Test **2021 – 2023**

- Placed 4th at Aerospace Russian Nationals (Camsat Russia, 130+ teams) with a 1.75 m aerobatic RC plane built from scratch (foam airframe, carbon-fiber spars, brushless motors, LiPo); 4 design cycles, 20+ test flights.

Two-Stage Solid-Fuel Rocket with Onboard Telemetry | Aerospace Club **2021 – 2023**

- Placed 2nd at Aerospace Russian Nationals (Camsat Russia, 130+ teams) with a two-stage rocket that reached ~5,000 m apogee; designed in SolidWorks, built, and flown with an onboard IMU, altitude telemetry, and stabilization sensors.

Stealth Startup | AI Topology Optimization for UAV Airframes (Founder) **2026 – Present**

- Building an AI platform that turns rough sketches into weight-optimized UAV airframes and exports them straight to SolidWorks; a GNN surrogate for finite element analysis scores stress on 1,000+ candidates.

LEADERSHIP & COMPETITIONS

Technology Student Association (TSA) | UAV/Drone Team Lead; VEX Robotics Captain **2023 – 2025**

- Led the Drone/UAV team to 1st at state and 7th nationally: airframe design, build, flight tuning, and mission prep. Captained the chapter's VEX Robotics team to 1st at state.

Aerospace Club | Flight Projects Lead **2021 – 2023**

- Led the UAV team to 3rd at Aerospace Russian Nationals (Camsat Russia, 130+ teams), flying autonomous missions.

SOFTWARE PROJECTS

Vale | Stealth Prop Trading Firm (Founder) **2026 – Present**

- Built a Rust research engine with 8,800+ tests behind a 5-lane CI gate; strategies must clear a statistical validation gate that rejects results explainable by chance, then a sealed out-of-sample holdout.
- Live tick-data pipeline across 25 crypto instruments; every research trial is logged to a hash-chained audit ledger.

Vext | Real-Time Multi-AI Platform (solo build) **2026**

- Async Rust (Axum, Tokio) backend streaming tokens to a Next.js frontend over WebSockets; 47+ Rust tests.

TECHNICAL SKILLS & AWARDS

Mechanical & Fabrication: CAD in SolidWorks, Fusion 360, OnShape, Blender; mechanism and mount design; cable-drive actuation; 3D printing; foam and carbon-fiber airframe fabrication; assembly.

Electromechanical: servos, brushless and DC motors, L298N H-bridge, FSR and IMU sensors, Li-ion and LiPo power, wiring and soldering, bring-up, bench and field testing.

Embedded & Software: Arduino (C/C++), Raspberry Pi (Linux), Rust, Python, TypeScript / React / Next.js, Git, Linux (Arch); AI-assisted engineering with Claude Code, including Fusion 360 through an MCP bridge.

Awards: Game Changers Hackathon 1st place (\$500, team captain); TSA state champion (Drone/UAV and VEX), 7th nationally.
